

# Transaction Policy

**Document Type:** Banking Transaction Policy

**Version:** 1.0

**Purpose:** Sample document for Generative AI / RAG application testing

**Note:** This is a fictional policy document created for software development, testing, and RAG demonstrations. It is not an actual bank policy.

## 1. Purpose

This policy defines transaction limits, authorization requirements, transaction monitoring rules, and transaction-status handling for banking customers.

## 2. Daily Transaction Limits

The standard maximum daily transaction limit for an eligible retail customer is **INR 100,000**.

The daily limit applies to the aggregate value of eligible transactions processed during the same banking day.

| Transaction Type       | Standard Daily Limit | Additional Authorization                 |
|------------------------|----------------------|------------------------------------------|
| Domestic Transfer      | INR 100,000          | Required above configured customer limit |
| International Transfer | INR 500,000          | Required above INR 250,000               |
| Bill Payment           | INR 100,000          | Normally not required within limit       |
| Utility Payment        | INR 50,000           | Required above INR 50,000                |

## 3. Domestic Transactions

A domestic transfer can be processed automatically when the transaction amount is within the customer's configured transaction limit and all applicable validation checks are successful.

A transaction exceeding the customer's configured daily limit must be routed through the required authorization workflow.

## 4. International Transactions

The standard maximum daily aggregate limit for an eligible international transaction is **INR 500,000**.

An international transaction exceeding **INR 250,000** requires additional authorization before processing.

International transactions may also be subject to applicable foreign-exchange, compliance, and bank-specific controls.

## 5. Authorization Requirements

Transactions exceeding the customer's configured transaction limit must not be processed automatically.

The transaction must be routed to the appropriate authorization workflow.

Authorization requirements may depend on:

- Transaction type
- Transaction amount
- Customer profile
- Beneficiary information
- Applicable banking controls
- Compliance requirements

## 6. Transaction Monitoring

Transactions may be monitored for unusual activity, including:

- Unusually large transaction amounts
- High transaction frequency
- Changes to beneficiary information
- Repeated transaction failures
- Unusual geographic patterns
- Other configured risk indicators

A transaction may be placed on hold when additional verification is required.

## 7. Failed Transactions

A failed transaction must not be considered successfully completed.

If a customer's account has been debited but the transaction has not completed successfully, the application should follow the applicable reversal or reconciliation process.

## 8. Transaction Status

The supported transaction statuses are:

- **INITIATED** — Transaction request has been created.
- **PENDING** — Transaction is awaiting further processing or authorization.
- **AUTHORIZED** — Required authorization has been completed.
- **COMPLETED** — Transaction has successfully completed.

- **FAILED** — Transaction processing was unsuccessful.
- **REJECTED** — Transaction was rejected by the applicable validation or authorization process.
- **REVERSED** — A previously debited transaction has been reversed.

Applications should display the latest confirmed transaction status to the customer.

## 9. Customer Support

Customers should provide the transaction reference number when raising a transaction-related support request.

Support personnel should verify the latest transaction status before initiating corrective action.

## 10. Transaction Reference

Every successfully created transaction should have a unique transaction reference number.

The transaction reference should be used to trace the transaction across relevant banking services.

## 11. Important Limits for RAG Testing

The following facts are intentionally included to test semantic retrieval:

- Standard retail daily transaction limit: **INR 100,000**
- International transaction daily limit: **INR 500,000**
- International transaction above **INR 250,000** requires additional authorization.
- Standard utility payment limit: **INR 50,000**
- Supported statuses: **INITIATED, PENDING, AUTHORIZED, COMPLETED, FAILED, REJECTED, REVERSED**

## 12. Disclaimer

This document is a fictional sample created exclusively for software development, Generative AI, RAG, vector database, and semantic-search demonstrations.

It should not be used as an actual banking policy or for real financial decisions.
